JobRadar

Smart Job Market Tracker

An AI-powered career intelligence platform that finds, analyzes, and helps you act on the right opportunities.

Version

1.0

Status

Draft

Date

April 2026

Job hunting today is broken. Listings are scattered across dozens of platforms, most are irrelevant noise, salaries are hidden, and you end up sending the same generic resume everywhere. You spend hours scrolling instead of minutes acting. **JobRadar fixes this by turning the job market into a personalized, intelligent feed that works for you — not the other way around.**

Product vision

"The right job, tailored resume, and clear action — delivered before you even search."

Who is this for?

1

Active job seekers

Engineers actively looking for their next role who want to move fast and not miss opportunities.

2

Passive explorers

Engineers happy in their current role but curious about market trends, salary benchmarks, and emerging skill demands.

3

Career planners

Engineers thinking 6-12 months ahead who want data-driven guidance on what skills to learn and where the market is heading.

1

Unified job feed

One clean stream of jobs from all major platforms. No duplicates, no stale listings, no noise. Every listing is normalized into a consistent format so you can scan and compare instantly.

2

AI skill intelligence

The system reads every job description and extracts the actual skills required — not just keywords. It separates must-haves from nice-to-haves and clusters similar roles regardless of title variations.

3

Personal match scoring

Every job gets a match score against your profile. The system weighs your skills, experience level, location preferences, and salary expectations to rank listings by how well they fit you specifically.

4

Market intelligence dashboard

Track which skills are trending up or down, see salary distributions by role and location, and spot emerging opportunities before they become competitive. Your personal career radar.

5

AI resume tailoring

One-click resume adaptation for any job. The AI rewrites your bullet points to mirror the role's language, emphasize relevant experience, and optimize for ATS filters. Includes cover letter generation.

6

Smart application pipeline

A managed workflow from discovery to submission. Review queue for approve/edit/skip decisions, application tracking with status updates, and automated follow-up reminders.

What it does

Aggregates job listings from multiple sources into a single, deduplicated, normalized feed. You see every relevant opportunity in one place without visiting ten different job boards.

User stories

USER STORY

As a job seeker, I want to see listings from all platforms in one feed so I never miss a relevant posting.

USER STORY

As a user, I want duplicate listings automatically removed so I don't waste time reviewing the same job twice.

USER STORY

As a user, I want to filter by role type, location, remote/hybrid/onsite, and salary range in one unified interface.

USER STORY

As a user, I want new listings highlighted so I can quickly see what's fresh since my last visit.

Key behaviors

- **Auto-refresh**
Feed updates on a schedule (hourly/daily configurable). No manual refresh needed.
- **Smart dedup**
Matches listings by title + company + location similarity, not just exact URL match.
- **Source badges**
Each listing shows its origin platform so you know where to apply.
- **Freshness decay**
Listings older than 14 days fade in priority. Stale postings sink, fresh ones rise.
- **Saved searches**
Pin your favorite filter combos and get notified when new matches land.

What it does

Goes beyond keyword matching. The AI reads each job description end-to-end and extracts a structured skill profile: what's truly required versus what's aspirational, what experience level is actually needed, and how this role relates to others with different titles but similar requirements.

Capabilities

Skill extraction

Parses every JD into a structured list of technical skills, soft skills, tools, and domain knowledge.

Must-have vs nice-to-have

Distinguishes between hard requirements and wishlist items so you know what actually matters.

Role clustering

Groups jobs by actual skill overlap, not title. A 'Frontend Dev' and 'UI Engineer' requiring React + TypeScript land in the same cluster.

Experience calibration

Detects whether '5+ years' means senior-level depth or just familiarity. Separates real requirements from inflated JDs.

Skill taxonomy

Builds a living map of how skills relate to each other. Knows that 'React' implies 'JavaScript' and clusters accordingly.

Example: how the AI reads a job posting

Raw JD input

"Looking for a senior full-stack engineer with 4+ years React..."

Extracted skills

React (must), Node.js (must), AWS (nice), GraphQL (nice)

Cluster assigned

Full-stack web — React/Node cluster

Match scored

Your profile: 87% match (3/4 must-haves, 1/2 nice-to-haves)

Personal match scoring

Every listing gets a personalized score based on how well it fits your specific profile. This isn't a generic relevance rank — it's computed against your actual skills, preferences, and career stage.

Market intelligence dashboard

Your personal career radar. Not just a job board — it's a live view of the market shaped around you.

What it does

Takes your base resume and adapts it for each specific role. Not a template swap — the AI rewrites your bullet points to emphasize the experience most relevant to what the employer is looking for, mirrors their language for ATS optimization, and generates a matching cover letter.

The tailoring process

Key principles

- Your data stays yours — the base profile is stored locally and never shared with third parties.
- Every tailored resume is reviewable and editable before export. The AI suggests, you decide.
- ATS optimization is baked in — clean formatting, standard section headers, keyword density checks.
- Cover letters reference specific company details and role requirements, not generic templates.

What it does

Manages the entire journey from discovering a job to tracking your application status. Think of it as a personal CRM for your job search — nothing falls through the cracks.

Pipeline stages

What it does

Proactive notifications that bring the right information to you at the right time. No more checking dashboards daily — the system reaches out when there's something worth your attention.

Alert types

High-match alert

Triggered when a new listing scores above your threshold (e.g. 85%+). Includes the tailored resume preview. Urgent — act fast before competition piles up.

Company watchlist

A company you're tracking just posted a new role. Even if the match score isn't perfect, you want to know immediately.

Follow-up reminder

It's been 7 days since you applied and haven't heard back. Time to send a polite follow-up. Includes a draft message.

Market shift

A skill you have (or are learning) just spiked in demand by 20%+. Or a skill you rely on is trending down. Strategic intelligence for career planning.

Weekly digest

A Sunday evening summary: new matches this week, applications in progress, upcoming follow-ups, and one market insight. Your weekly career briefing.

Delivery channels

- **Email**
Rich HTML digest with one-click actions (approve, skip, open dashboard).
- **Slack/Discord**
Short real-time pings for urgent alerts like high-match or watchlist triggers.
- **In-app**
Dashboard notification center with full context and action buttons.
- **WhatsApp (future)**
Quick summary messages with deep links back to the dashboard.

Phase 1 — Foundation

Weeks 1-3

- Unified job feed with 2-3 data sources (Adzuna, JSearch, HN)
- Basic deduplication and normalization pipeline
- Simple web UI to browse and filter listings
- User profile setup (skills, preferences, location)

Phase 2 — Intelligence

Weeks 4-6

- AI skill extraction from job descriptions
- Personal match scoring algorithm
- Role clustering and skill taxonomy
- Basic dashboard with match scores and trends

Phase 3 — Resume engine

Weeks 7-9

- Base profile management and storage
- AI resume tailoring per role
- Cover letter generation
- PDF export with ATS-friendly formatting

Phase 4 — Pipeline & alerts

Weeks 10-12

- Application tracking pipeline (kanban-style)
- Smart alerts (high-match, watchlist, follow-up)
- Weekly digest emails
- Salary heatmaps and skill gap analysis

How we know it's working

These are the outcomes that prove JobRadar is delivering real value — not vanity metrics, but signals that you're spending less time searching and more time acting on the right opportunities.

Time to first relevant job

< 5 minutes

From opening the app to seeing a job worth applying for. Currently this takes 30-60 min across multiple sites.

Resume tailoring time

< 2 minutes

From clicking 'tailor' to having a ready-to-submit PDF. Manual tailoring takes 30-45 min per application.

Application response rate

2x baseline

Tailored resumes should double your callback rate vs generic submissions. Track over 30+ applications.

Listings reviewed per session

10x fewer

You should review 5-10 high-match listings instead of scrolling through 50-100 irrelevant ones.

Zero missed opportunities

0 regrets

No more discovering a perfect role 3 weeks after it was posted. Watchlists and alerts catch everything.

This is a living document.

Features, priorities, and metrics will evolve as we build and learn. Review and update weekly.
